

THE CHALLENGE

To install the foundations for a new garden room in the back garden of a terraced property, where the site posed the following challenges:

- ⊞ Limited access meant the garden could only be reached by going through the house itself.
- ⊞ Client required minimal spoil removal and disruption

THE SOLUTION

Using the QuadraPile system, we installed a grid of piles with steel plates attached to the top of each, onto which the floor structure could be attached.

We completed the foundations in less than two days and the site was then immediately ready for the construction of the building without

needing to wait for concrete to cure. There was also no requirement for excavations or removal of spoil which would have been necessary with traditional foundations.

Although usually a more permanent solution, our system is also fully removable and recyclable should the building no longer be required.

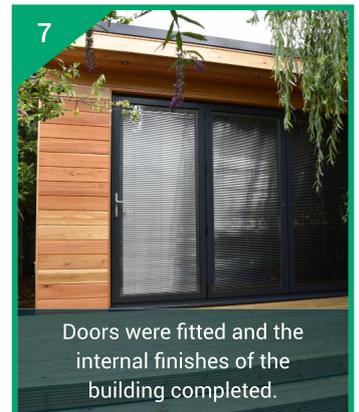

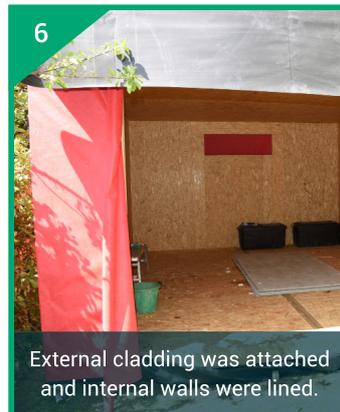

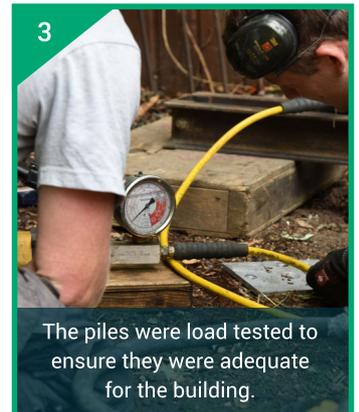

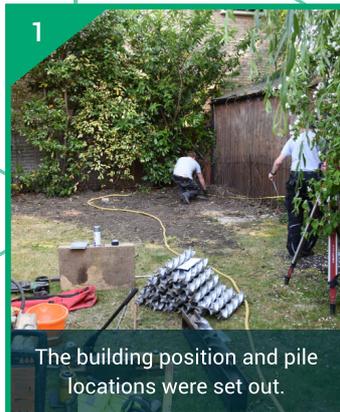

✓ Minimal disruption

✓ Clean, fast, efficient

✓ No mess foundations

✓ Limited access sites
